

Medium-Mu Triode

GLASS-METAL PENCIL TYPE

*For Use at Frequencies Up to 4000 Mc/s in Pulse Service
and 2000 Mc/s in CW Service*

ELECTRICAL

Heater, for Unipotential Cathode

Voltage (AC or DC):

Under transmitting conditions. 6.0 \pm 10% V

Under standby conditions. 6.3 max V

Current at 6.0 V 0.300 A

Amplification Factor 40

Transconductance 7300 μ mhos

For dc plate current of 22 mA and

dc plate voltage of 200 V

Direct Interelectrode Capacitances (Approx.)

Grid to plate. 1.8 pF

Grid to cathode. 3.2 pF

Plate to cathode. 0.07 max pF

MECHANICAL

Operating Position Any

Dimensions and Terminal Connections . . See *Dimensional Outline*

Plate Seal Temperature 175 max $^{\circ}$ C

Weight (Approx.) 0.4 oz

Sockets

Heater terminals connector. Grayhill No. 22-3^a

TERMINAL CONNECTIONS (See *Dimensional Outline*)

H—Heater

K—Cathode (Cylinder

G—Grid (Flange between
glass sections)

P—Plate (Cylinder
adjacent to pinch-off)

PLATE-PULSED OSCILLATOR^b—CLASS C

Maximum CCS^c Ratings, Absolute-Maximum Values

*For a maximum "ON" time^d of 5 microseconds in any
500-microsecond interval.*

For altitudes up to 30,000 feet

Up to 4000 Mc/s

Peak Positive-Pulse Plate-Supply Voltage^e. 2000 V

Peak Grid-Bias Voltage

Negative pulse 150 V

Positive pulse 25 V

Peak Plate Current 3 A

From pulse supply

Peak Rectified Grid Current. 1.5 A

DC Plate Current 0.03 A

Up to 4000 Mc/s

DC Grid Current	0.013	A
Plate Dissipation [†]	7	W
Pulse Duration	5	μs

Typical Operation with Rectangular Wave Shape in
Cathode-Drive Circuit at 3300 Mc/s

With duty factor^g of 0.01 and pulse duration of 1 microsecond

Peak Positive-Pulse Plate-Supply Voltage ^e	1750	V
Peak Negative-Pulse		
Grid-bias voltage	110	V
From grid resistor of	100	Ω
Peak Plate Current	3	A

^b In this class of service, the heater should be allowed to warm up for a minimum of 60 seconds before plate voltage is applied.

^c Continuous Commercial Service.

^d "ON" time is defined as the sum of the duration of all individual pulses which occur during the indicated interval. Pulse duration is defined as the time interval between the two points on the pulse at which the instantaneous value is 70% of the peak power value. The peak value is defined as the maximum value of a smooth curve through the average of the fluctuations over the top portion of the pulse.

^e The magnitude of any spike on the plate voltage pulse should not exceed a value of 2000 volts with respect to cathode and its duration should not exceed 0.01 microsecond measured at the peak-pulse-value level.

^f In applications where the plate dissipation exceeds 3 watts, it is important that a large area of contact be provided between the plate cylinder and the connector in order to provide adequate heat conduction.

- g Duty factor is the product of pulse duration and repetition rate. For variable pulse durations and pulse repetition rates, the duty factor is defined as the ratio of time "ON" to total elapsed time in any 500-micro-second interval.
- h The power output at peak of pulse is obtained from the average power output using the duty factor of the peak pulse. This procedure is necessary since the power output pulse duty factor may be less than the applied voltage pulse duty factor because of a delay in the start of rf power output.
- j Modulation, essentially negative, may be used if the positive peak of the audio-frequency envelope does not exceed 115 percent of the carrier conditions.
- k Intermittent Commercial and Amateur Service.
- m From a grid resistor, or from a suitable combination of grid resistor and fixed supply or grid resistor and cathode resistor.
- n This value of useful power is measured at load of output circuit having an efficiency of about 75 percent.

DIMENSIONS IN INCHES

Note 1: Max. eccentricity of center line (Axis) of plate terminal or grid-terminal flange with respect to the center line (Axis) of the cathode terminal is 0.010 inch.

Note 2: Tilt of grid-terminal flange with respect to rotational axis of cathode terminal is determined by chucking the cathode terminal, rotating the tube, and gauging the total travel distance of the grid-terminal flange parallel to the axis of a point approximately 0.020 inch inward from its edge for one complete rotation. The total travel distance will not exceed 0.020 inch.
